

Wall (2019) in his article talks about the application of CNN technology by the police forces around the world, questioning whether such technology makes mistakes or is biased given the way it was tuned.

In my view, given the criticality of using such technology for facial recognition and the fact that a wrong matching could have severe impact on a person's life, CNN technology should be well tuned and trained but not used now in practice.

Though I am not opponent of the use of CNN technology by police forces, I believe that currently the available tools are biased and in turn more training is needed. On top of that, I think that to put in practice such technology, the regulatory framework should be developed to set up the rules of using this kind of technology as well as the relevant restrictions. Such framework is a must to reduce the likelihood of using this kind of technology for inappropriate activities or going beyond one's civil liberties.
